PROFESSIONAL SUMMARY

Cloud Platform and Infrastructure Engineer with 6+ years of experience designing, automating, and operating secure enterprise platforms across AWS, Azure, and Windows-based environments. Architects reusable, automation-first platform capabilities spanning multi-account cloud foundations, identity and access management, infrastructure provisioning, secure delivery, and PCI-aligned controls. Combines hands-on depth in Windows, Linux, networking, Kubernetes, and enterprise application integration with a focus on resilient operations, strong developer enablement, and scalable governance.

CORE EXPERTISE

- Cloud foundations & governance: AWS Organizations, multiaccount landing zones, EC2, VPC, VPN
- Platform automation: Terraform, Ansible, AWX, Python, PowerShell, AWS Lambda
- Identity & endpoint engineering: Active Directory, Entra ID, Intune, RBAC, GPO, RDS
- Secure delivery & runtime: CI/CD, Kubernetes, Windows Server, Linux, L3 support
- Security architecture: PCI 4.0 controls, PKI/PKCS, AppLocker, hardening, certificates
- Engineering enablement: technical documentation, standardisation, ITSM integration, cost optimisation

PROFESSIONAL EXPERIENCE

Infomil Mauritius | Software Integration Engineer

Jun 2026 – Present

- Configured and maintained Entra ID hybrid identity, including on-premise Active Directory synchronization and connector setup, ensuring reliable, consistent directory integration across on-prem and cloud environments.
- Implemented application allowlisting with AppLocker and secure device enrolment through Microsoft Intune and Entra ID, strengthening endpoint control and identity-based access.
- Engineered and maintained PKI/PKCS certificate services for device and endpoint certificate deployment, enabling trusted device access and more reliable certificate operations.
- Administer and troubleshoot Windows Server, Active Directory, Group Policy, and Remote Desktop Services (RDS) farm environments, maintaining reliable access to core enterprise services.
- Diagnose complex network connectivity and access-management issues across users, endpoints, applications, and infrastructure, providing Level 3 escalation support.
- Designed and supported GLPI infrastructure to improve IT service-management operations and provide a dependable platform for support teams.
- Integrate and deploy business applications and third-party software; coordinate controlled production releases with the Delivery and Operations Manager, contribute to technical acceptance, and standardise procedures through clear operational documentation.

Checkout.com | Cloud Platform and Infrastructure Engineer

Nov 2020 – Feb 2026

- Architected and maintained the AWS multi-account foundation using AWS Organizations, automated account vending, and baseline guardrails, strengthening governance and accelerating secure environment onboarding.
- Standardised infrastructure delivery through reusable Terraform and Ansible patterns, enabling repeatable provisioning and embedding secure deployment practices across environments.
- Automated Active Directory user and service-account lifecycle workflows using Python, Ansible, and ITSM integrations, reducing manual intervention and improving process consistency.
- Built AWS Lambda automations for resource cleanup, compliance checks, workflow triggers, and governance activities, shifting recurring operational work into reliable, event-driven services.
- Engineered and operated hardened Windows and Linux workloads on Amazon EC2, aligning platform configurations with PCI 4.0 requirements and secure operational standards.
- Architected secure AWS network patterns spanning VPC segmentation, jump hosts, VPN tunnels, and access controls; partnered with security and compliance teams to make PCI-aligned connectivity practical and operationally effective.
- Designed and deployed a Kubernetes-based data-processing workload with secure key management, automated CI/CD delivery, and monitoring, applying production-minded controls to a containerised platform service.

- Enabled consistent infrastructure provisioning and application deployment through CI/CD integrations, connecting reusable infrastructure patterns with deployment workflows for engineering teams.
- Served as the platform subject-matter expert for AWS Transfer Family, IAM design, and least-privilege access management; translated platform requirements into clear patterns for security, delivery, and operations teams.
- Created operational documentation and knowledge-sharing practices that enabled L1/L2 teams to resolve routine issues independently, increasing team self-sufficiency and reducing escalation load.
- Led AWS cost-optimisation initiatives that improved spend visibility and reduced waste across cloud accounts; also managed golden images, certificate lifecycle, and antivirus platforms across AWS and Azure estates.

Dayforce (formerly Ceridian) | Implementation Consultant, Technical Services

Dec 2019 – Nov 2020

- Developed, customised, and maintained client solutions using DF Link methodology and XML/XSLT, delivering tailored Payroll, HR, and Benefits exports in partnership with clients and vendors.
- Gathered and refined technical requirements, led stakeholder review sessions, prioritised delivery work, and resolved implementation issues to support timely project outcomes.

EDUCATION

BSc Computer Science (Networks), First Class Honours | University of Hertfordshire, UK

- Final-year penetration-testing and Linux server security evaluation project: produced risk assessment and remediation recommendations (94% grade).
- Final-year dissertation: evaluated SSL/TLS handshake cryptographic algorithms for security and performance, earning a first-class grade.

Cambridge A Levels and O Levels, Science Path | Royal College Curepipe, Mauritius

ADDITIONAL STRENGTHS

- Cross-functional collaboration, technical documentation, process standardisation, and operational knowledge transfer.
- Hands-on platform mindset spanning reliable delivery, secure access, automation, and cost-conscious infrastructure operations.
